## **Open Healing WRITTEN**

## infant frenectomy post-op, Shervin Yazdi, DDS

Most babies experience discomfort for the first few days after the procedure. Provide pain medication as well as skin to skin warm bath (minding fresh C-section wound and umbilical stump water exposure guidelines). The healing site will change colors (white, yellow, green, etc.) and then normalize. A bit of blood early on should not be a concern as it is usually mostly saliva. Breastfeeding is one way to stop the bleeding. In the unlikely event that bleeding continues use a napkin or a moistened tea bag and apply pressure on the wound for a few minutes. If concerned contact us for help.

## Diligent wound management reduces the risk and extent of re-attachment

- Differing healing potential, infant temperament, and parenting styles are taken into account in choosing the range of performing every 3-6 hours for 5-6 weeks.
- Many parents choose to perform about every **5 hours** for **5 weeks** with good results.

o The lip: Lift - Press

• The Tongue: Lift - Press

## Wound Care Technique Details and reminders below:

Start about 4 hours after the procedure. <u>Proper pain control</u> also helps you <u>focus</u> due to a clear conscience; <u>shorten index fingernails</u>; wash hands or use <u>Nitrile</u> gloves (no latex gloves please); use <u>proper positioning</u> with baby's feet away from you; safely restrain baby, stabilize the head, take a <u>close look with a HEAD LAMP</u>, use <u>medium</u> pressure; press @ fold to keep wound open

**Lift:** retract the tissue well to expose diamond Press: only once with pad of index finger

Don't: place baby on lap, don't press lightly, don't press tongue nor corner of mouth, don't rub control pain, use headlamp, keep elbow down, use dominant side, parents to alternate

- Just a few seconds every few hours and you shall succeed -
